Transmission Line " A line that carries electricity at voltages of 69kV or greater and is used to transmit electric power over relatively long distances, usually from a central generating station to main substations.

Transmission Structures " Used to keep high-voltage conductors (power lines) separated from their surroundings and from each other.

physics of power generation and transmission indicate that high speed and low torque are more efficient to create than low speed and high torque. The former is generated by high voltage and low current which is more economical than low voltage and high current. Once again, a transmission is often required to transform power into a useful form.

To clearly describe power transmission facilities, it is necessary to draw a distinction between transmission and distribution, both of which refer to the transport of electricity. Distribution refers to supplying power to retail customers. Distribution lines normally run from substations through a distribution line network.
